12	Export	T – 220-240V 50Hz or 208-230V 60Hz X – 380-415V 3N~50Hz or 380-415V 3N~60Hz		

3 Product Features

3.1 General introduction

Gree DC Inverter Multi VRF System II is the latest generation of DC inverter units. One set of air-cooled outdoor unit can be connected with multiple direct evaporation indoor units that are of the same or different forms and capacity. This refrigerating system can directly provide air conditioning for one or more areas, and is applicable for residential and light commercial uses. It features high energy efficiency, strong anti-interference capability, long connectable pipe, wide operation range, good sound quality, intelligent capacity regulation, complete protection, etc.

3.2 Features

(1) Super high energy efficiency

The 2nd generation of DC Inverter Multi VRF System adopts DC motor to realize complete direct current and upgrade the energy efficiency. EER is up to 3.97 and COP can reach 4.28.

(2) New generation CAN bus communication

Due to the latest communication method—CAN Bus Communication, system's anti-interference capability is stronger and the control on indoor units is more accurate, with higher reliability. Specialized shield wire is no more needed and ordinary communication wire can be applied in the construction, which has increased the installation flexibility.

(3) Long connection pipe

The maximum length of connection pipe is 300m (in total) and the farthest connection pipe between indoor and outdoor units can be 120m's long, which has extended the installation condition and reduced the limit of installation distance.

(4) Wide operation range

Units can operate reliably in a wide temperature range (cooling: -5~52℃, heating: -20~27℃).

(5) Fine sound quality

Through a series of optimized measures, system has reduced the throttle noise and oil return noise of indoor units, gas bypass noise, etc. so that units are more comfortable regarding sound quality.

(6) Intelligent PID capacity regulation

With the independently developed PID capacity regulation technology, units are able to control the indoor ambient temperature more quickly and reduce the fluctuation of room temperature.

(7) Complete protection

Units are equipped with a series of protection to accurately identify errors and protect the units, which has ensured reliable and safe operation.

Note:

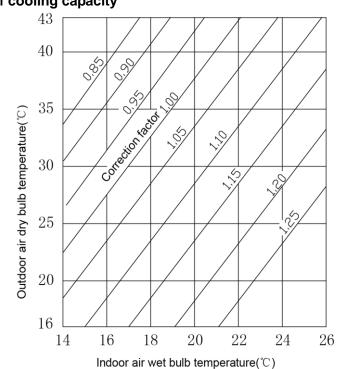

- ① Units conform to design standard: EN 14511.
- ② Specifications may be changed due to product improvement. Please refer to nameplates of the units.
- ③ Noise data are collected from a semi-anechoic room. Decibels may be slightly higher in actual operation due to environmental change.
- ④ Refrigerant charge volume listed in the table is based on the condition where indoor and outdoor units are at a same level and with no connection pipe. Supplementary refrigerant needs to be charged according to actual circumstance.
- ⑤ The sectional area of conducting wire is only applicable when the length is within 15m. If it's over 15m's long, sectional area must be increased accordingly, otherwise, over-current may burn the wires.

4.2 Operation range

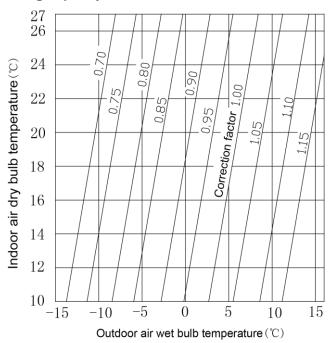

Cooling	Outdoor temperature: -5 \sim 52 $^{\circ}$ C
Heating	Outdoor temperature: -20°C ~27°C

5 Product Capacity Correction

5.1Correction factor of indoor and outdoor temperature 1) Correction factor of cooling capacity

2) Correction factor of heating capacity

5.2 Correction factor of pipe length and height difference

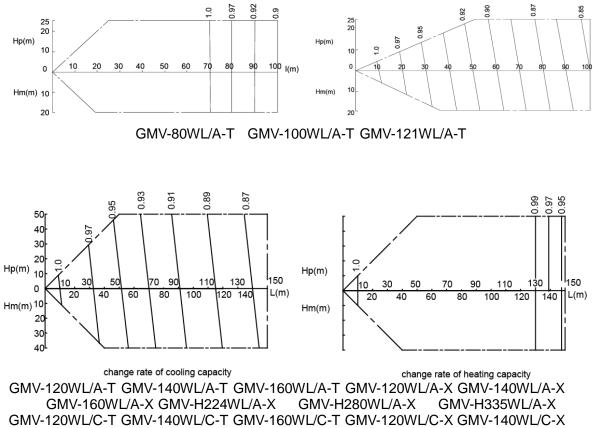

• Symbol description:

Hp: Height difference in case indoor unit is below outdoor unit (m);

Hm: Height difference in case indoor unit is above outdoor unit (m);

L: Length of one-way equivalent pipe

• Below table shows the capacity variance ratio for 100% full load in standard working condition (thermostat setting is 16° for cooling and 30° for heating).

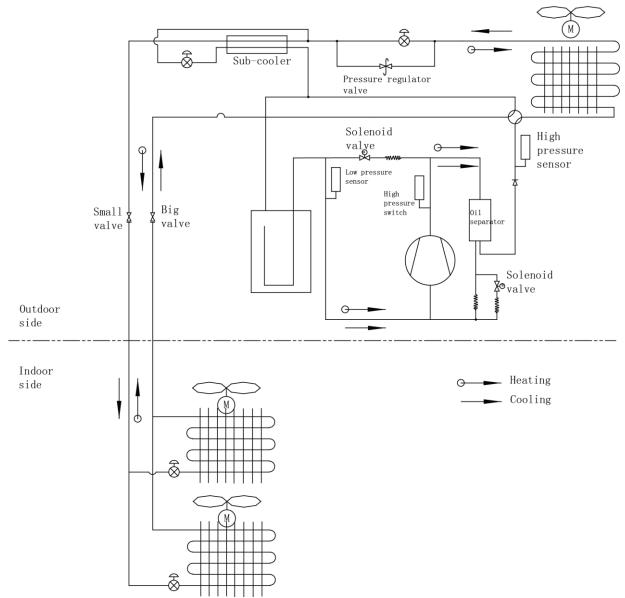

GMV-160WL/C-X GMV-224WL/C-X GMV-280WL/C-X GMV-335WL/C-X

6 Principal of Operation

Components in flowcharts are presented according to the following table:

Name	Compressor	4-way valve	Cut-off valve	One-way valve	Capillary tube
Symbol	\bigcirc				WW
Name	Gas-liquid separator	Pressure switch	Pressure sensor	Axial-flow finned heat exchanger	Electronic expansion valve
Symbol	Ļ	J			-&

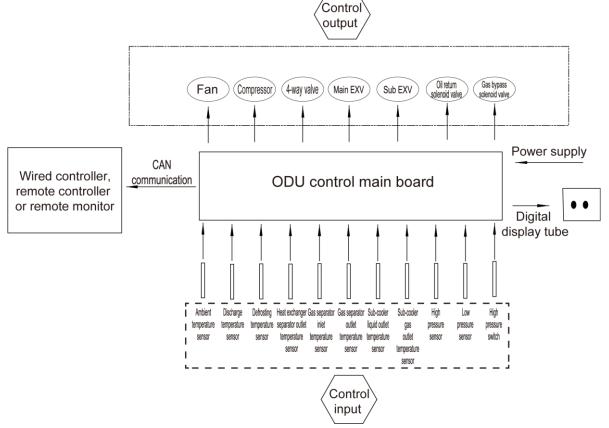

In cooling, the low-temperature and low-pressure refrigerant gas from each indoor heat exchanger will be merged and inhaled by the compressor and then become high-temperature and high-pressure gas, which will later be discharged into outdoor heat exchangers. By exchanging heat with outdoor air, refrigerant will turn to liquid and flow to each indoor unit via Y-type branch or manifold. Pressure and temperature of the refrigerant will then be lowered by throttle elements before it flows into indoor heat exchangers. After exchanging heat with indoor air, refrigerant wil become low-temperature and low-pressure gas again and repeat the circulation so as to realize the cooling effect. In heating, 4-way valve will be energized to make refrigerant circulate in a reverse direction of cooling. Refrigerant will release heat in indoor heat exchangers (electric heating elements will also work under certain circumstance and release heat) and absorb heat in outdoor heat exchangers circularly so as to realize the heating effect.

CONTROL

CONTROL 1 Units' Control

1.1 Schematic diagram of units' control

1.2 Interpretation on the schematic diagram

- High pressure switch is used to identify system's high and low pressure. When pressure is too high, the switch will break off and send a signal to main board. Main board will pass this signal to controller, where the error will be displayed, and stop unit from working.
- High/low pressure sensor is used to test unit's high/low pressure and send real-time data to controller, which will control each unit's output according to the control logic.
- Temperature sensors are used to test the tube temperature of the unit and send data to the controller, which will control each unit's output according to the control logic.

2 Remote Monitoring System

2.1 General introduction

Gree CAC Remote Monitoring System is an automatic central management system as well as an intelligent power management system based on internet or local area network. It can provide a complete set of air conditioning solutions, including remote monitor, malfunction alarms and visual management, for the real-time, safe and efficient management of air conditioners.

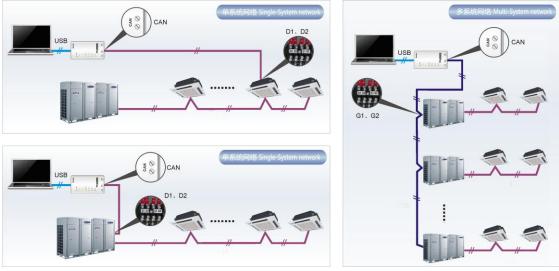

Gree CAC Remote Monitoring System can save your cost on human resources and equipment management. User can check the running status of air conditioners, turn units on or off, set temperature or other functions just by means of a browser (e.g. IE, Firefox, Chrome) in every corner of the world.

3 Monitoring Software

3.1 Function introduction

With the rapid development of building complex, more and more central air conditioners in various models are used in different places, resulting in inconvenience for the management of air conditioners. Integrating with telecommunication technology and computing software, Gree Commissioning Tool Kits can realize the comprehensive monitor, control and commissioning on central air conditioners. It is an efficient solution for the management of central air conditioners that are separated in different parts of a building. Administrator doesn't need to control every unit on site, but rather controls the units by just sitting in front of a computer. This will not only improve the productivity, but also reduce cost on human resources, property and management.

Gree Commissioning Tool Kits can monitor and control the 2nd generation of Gree Multi VRF. User can monitor and control units by monitoring the computer. This software is an efficient tool for the intelligent air conditioning management as well as installation and after-sales service and commissioning. It can debug units and control units' operation status quickly and conveniently. It will not only improve the productivity but also reduce the difficulty and cost of commissioning and maintenance, providing better and faster service to customers.

3.2 Connection of computer and units

It can be connected with single-system network or multi-system network. In the single-system network, indoor units or outdoor units are connectable, while in the multi-system network, only the master outdoor unit can be connected.

Seen from the diagram, Gree commissioing network is made up of 3 parts:

The 1st part is the monitoring computer, including Gree debugger and Gree USB converter driver that are installed in the computer.

The 2nd part is Gree USB converter, which is to convert the air conditioning communication into computing communication. This part is made up of Gree USB data converter and USB data wire.

The 3rd part is air conditioners, including outdoor units, indoor units and the connection wires. If connection wire is not long enough, it's OK to connect via the patching board of the commissioning tool

kits. In a single-system network, both indoor units and outdoor units can be connected, while in a multi-system network, only the master outdoor unit can be connected.

3.3 Parts introduction 3.3.1 List of parts

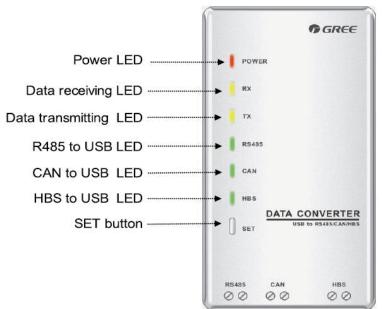

Name	Model	Material no.	Remark
Gree USB data converter	MC40-00/B	30118027	Convert the air conditioning communication into computing communication
Gree Commissioning Tool Kits (CD-ROM)	DG40-33/A(C)	36400000003	Include Gree debugger, monitoring software, USB driver and USB converter configuring software.
USB wire	/	40020082	Wire connecting computer's USB interface and converter
Communicaiton board	١	30118015	This board can be used when units are far from the computer.
Board connection wire (1m)	\	4001023229	4-core wire connecting units and converter
Board connection wire (5.5m)	\	4001023214	4-core wire connecting units and converter
Instruction manual		66174100018	Instruction manual

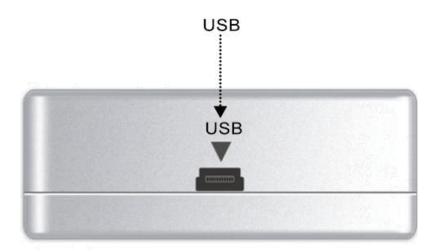

3.3.2 Gree USB data converter

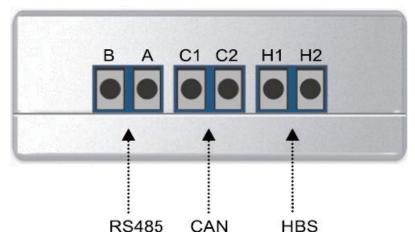

3.3.2.1 Functions introduction

Gree USB data converter will convert the RS485, HBS and CAN commucation within the air conditioners into the communication that is recognizable by computer's USB interface.

3.3.2.2 Appearance

3.3.2.3 Operation instruction

- Power LED: a red light. If the red light is on, it indicates normal power supply. If the red light is off, it indicates the power supply of converter is not normal.
- Communication LEDs: yellow lights. When converter is working and the computer is transmitting data, the TX data transmitting light will be flickering. When units are uploading data to the computer, the RX data receiving light will be flickering.
- When converter is under RS485 data transferring mode, the function LED of RS485 to USB will be on.
- When converter is under CAN data transferring mode, the function LED of CAN to USB will be on.
- When converter is under HBS data transferring mode, the function LED of HBS to USB will be on.
- USB interface: connect USB data wire.
- CAN interface: When converter is under CAN communication mode, connect air conditioner's CAN data interface. CAN interface exhibits no polarity (A and B are equal).

- HBS interface: When HBS converter is under HBS communication mode, connect air conditioner's HBS data interface. HBS interface exhibits no polarity (This interface is not yet available for Gree debugger and the monitoring software).
- RS485 interface: When RS485 converter is under RS485 communication mode, connect air conditioner's RS485 data interface. RS485 interface exhibits polarity and terminal A and B are different.

3.3.2.4 Installation notice

- Install indoors. To avoid collision, it is suggested to place it in the monitoring room together with the computer.
- No need of power supply. Power is supplied through computer's USB interface.

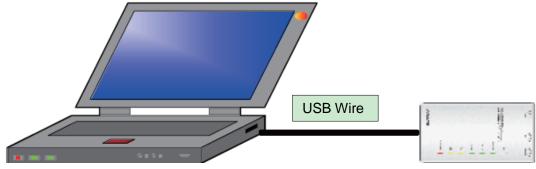

3.3.3 Communication board

Communication board is mainly used for transferring data. It functions similar with a patching board. Provided that units are far away from the monitoring computer, communication board can be used for connection.

3.3.4 Communication cord

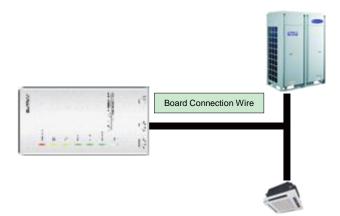

3.3.4.1 USB wire

• Connect USB wire with computer's USB interface at one end and with the USB interface of USB data converter at the other end, as indicated below:

3.3.4.2 Board Connection Wire

• There are 2 board connection wires supplied for the commissioning tool kits. One is 1 meter's long and the other is 5.5 meters' long. They are only different in length. One end of the wire shall connect with air conditioner's communication interface and the other end shall connect with CAN interface of Gree USB converter. As shown below, the wire can be connected to the communication interface of outdoor unit or the communication interface of indoor unit:

3.4 Software introduction

(1) One-button commissioning

Personnel responsible for the commissioning of air conditioners can start commissioning by pressing one button according to the commissioning logic of software, which will give the commissioning order to units. Then commissioning will be started up automatically step by step. During the commissioning, the corresponding process will be ticked in green on the software interface. If any commissioning process is not normal, it will be displayed in red.

(2) Comprehensive monitoring

The software can monitor every part of the air conditioning system, including functions, equipment and components operating status. The monitoring results will be displayed in text or curve so that user can acquire the operating status of the entire system conveniently and straightforwardly.

(3) Real-time control

Air conditioner's operating time and requirements may be different based on areas and functions. User can set units' parameters on computer according to actual needs, such as the on/off, temperature, fan speed, mode, etc. Meanwhile, the software can also set or view the function parameters of outdoor units, gateway and other equipment. In this way, the mangement of central air conditioners is realized.

(4) Replay history

Software can replay and save the historical monitoring information in the data base. The replay speed can be selected and the information will be shown in text or curve. This function has greatly saved the time to track problem cause and resolved the difficulty of problem reproduction.

(5) Applicable to multiple series, models and users

Gree Commissioning Tool Kits is applicable to air conditioning system that comsists of multiple series and models. Later, it will be developed to cover all series of Gree central air conditioners, such as multi VRF, centrifugal chiller, screw type chiller, ground source heat pump units, modular units, fan coiled units, close control units, etc. It can be used by system and controller designers to develop and monitor units, or used for maintenance and commissioning.

(6) Other functions

For the convenience of users, the software has added functions like connection guide, printing screen, opening database folder, rebuilding database, changing database saving path, etc.

3.4.1 Software installation

3.4.1.1 Installation requirements

(1) Computer Configuration

Memory	1 GB at least 2 GB or above is preferred
Hard Disc	10 GB available
CPU	Core 2 or higher 1 GHz at least 2 GHz or above is preferred
Operation System	Windows Server 2003 SP3 or higher Windows XP SP3 or higher Windows Vista Windows 7

(2) CD Playing

Make sure you have administrator access to the computer and there is a CD-ROM in the computer.

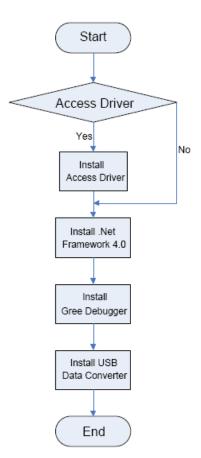

Put the CD into the CD-ROM. If it's automically running, then the following display will be shown. Or double-click the file "Launcher.exe".

Install.Net Framework 4.0	Install Gree USB Data Converter
Install Gree Debugger	Installtion Guide
Install Gree Text Parser	Exit
Install USB Converter Driver	F GREE
Install Access Driver	

For the first time to use Gree Commissioning Tool Kits, install these programmes: .Net Framework 4.0, USB Data Converter, Access Driver (necessary for versions below OFFICE 2007), Gree Debugger.

3.4.1.2 Installation flowchart

Button Graphics

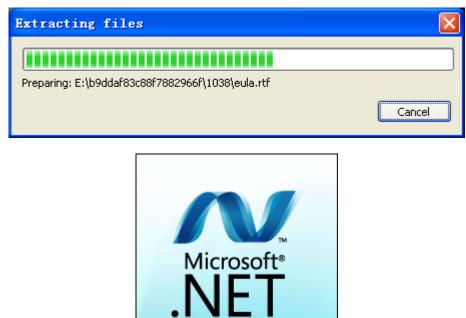

This flowchart describes basically the software installation process. See below for details.

3.4.1.3 Installation process

- (1) Install .Net Framework 4.0
 - If your computer has installed .Net Framework 4.0 or versions above, there's no need to install again. Otherwise, click "Install .Net Framework 4.0".

• Extracting files

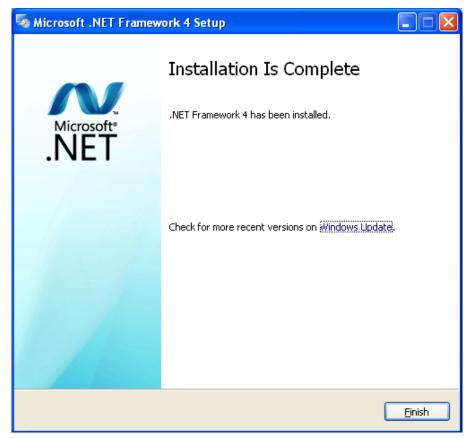

• Click and select "I have read and accept the license terms". Then click "Install".

• Click "Finish" to complete the installation.

3.4.2 Data monitoring

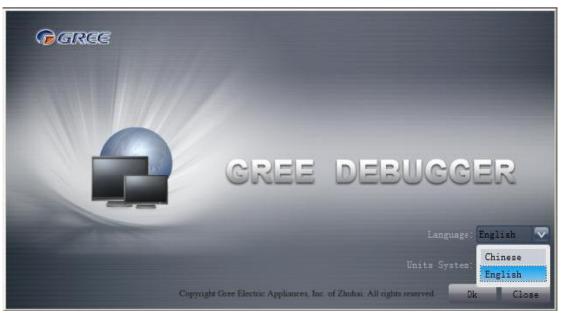

• Start up Gree Debugger.

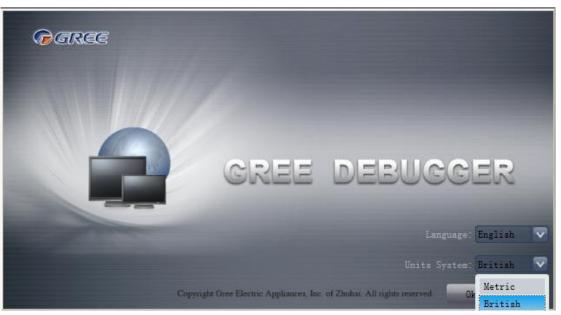

• On the original interface, user can select language and units system. Click "OK" to confirm the defaulted language and units system and start up the software.

Select language.

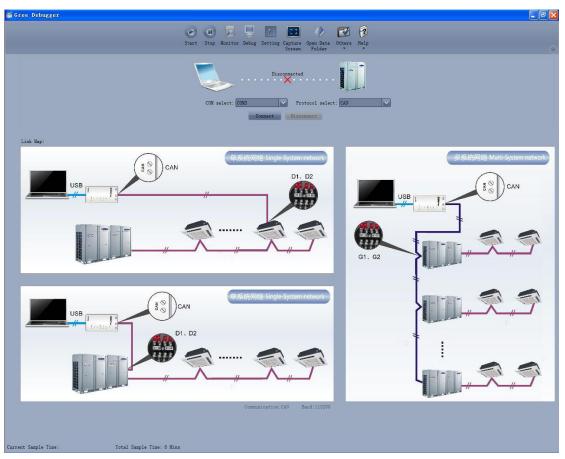

• Select system of units.

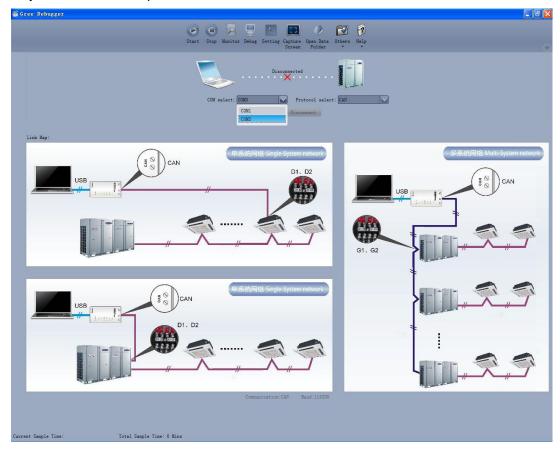

• If units you want to monitor are already connected, and able to communicate normally, with correct COM and protocal, then you may click "Connect" to enter the interface of numbers. Otherwise, connect in accordance with the connection diagram shown below.

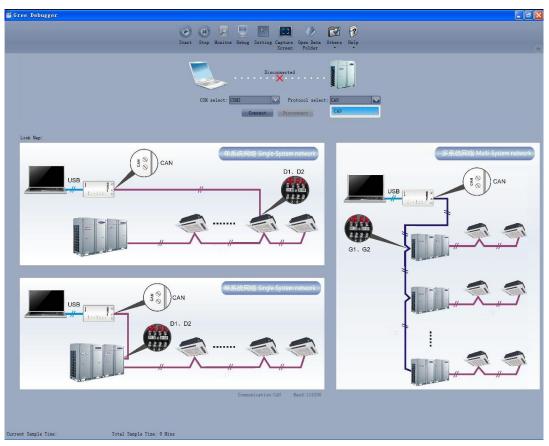

DC Inverter Multi VRF System II Service Manual

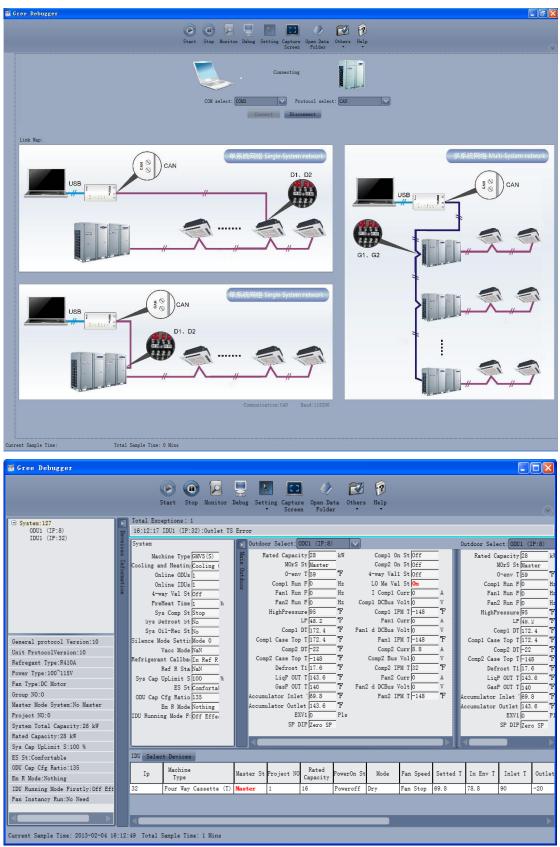

• COM selection: the serial port in your computer can be detected automatically. You just need to select your desired serial port.

• Protocal selection: This is to select the communication method of your units. Currently, CAN is applicable to the units.

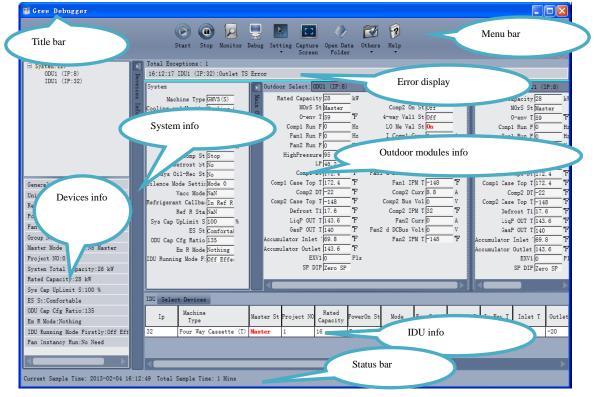

• After the selection, click "Connnect". If units can communicate normally with computer, then the interface of numbers will be shown soon. Otherwise, "Connecting" will be shown.

• There are several display zones on this interface. You can hide devices information and system information by clicking devices information icon Pland system icon Pl. Display zones of indoor unit information and errors can be dragged up and down at the dividing lines. As to the display zone of outdoor modules information, it can show information of only one module and hide information of

others (two modules are defaulted to be shown). Menu bar can be hidden by clicking icon status bar shows the current time and period for data collection.

• On the display zone of devices information, you may click to select and view units that need monitoring.

Conversion of pressure value

• Click icon of "Others" on the menu bar and then click "Display Settings" to select "High Low Pressure Value" and "Refrigerant Type". Select "Temperature" and the pressure parameter

displayed on the interface will be temperature. Select "Pressure" and the pressure parameter displayed on the pressure interface will be pressure. Refrigerant type will affect the pressure parameter displayed on the interface.

Change database saving path and rebuild database

 Change of database saving path and rebuilding of database should be set before the software starts monitoring (see below interface). Click "Change database saving path" and click "Browse" to change the saving path. Click "Rebuild Database" to rebuild the database folder. You can also stop monitoring and turn back to the connection interface to change saving path or rebuild database during monitoring.

3.4.6 Usage of USB Converter

Usage of converter

• Gree commissioning software should be connected with CAN interface when converter is used. For air conditioners with a single system, connect D1 and D2 interfaces of the wiring board. For air conditioners with multiple systems, connect G1 and G2 interfaces of the wiring board.

Gree monitoring software should be connected with RS485 interface when converter is used.
 Connect outdoor or indoor units or the mainboard of wired controller according to actual needs.

 HBS, CAN and RS485 of the converter can be switched by buttons. Press the button "SET" on the converter to realize the conversion among HBS, CAN and RS485 interfaces. You can check the setting through the function LEDs.

Notice: If it's the first time your PC uses Gree USB data converter, in order to prevent Gree USB data converter from being mistaken by your computer as other devices and make sure your mouse can work well, it is necessary to turn off the Serail Enumerator of computer after Gree USB data converter is connected. Below are the steps:

Step 1: Right-click "My Computer" on the desktop and click "Manage".

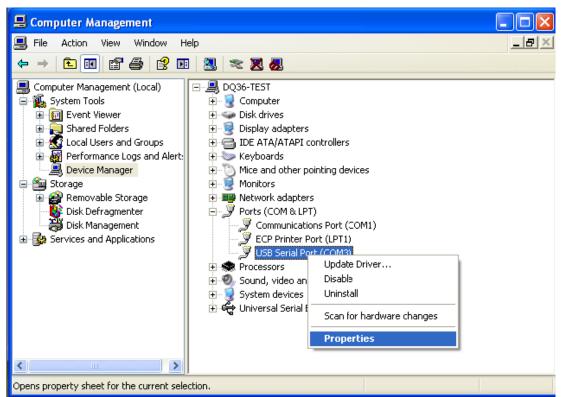

Step 2: In the pop-up window, select "Device Manager" in the left column and then find "Port (COM and LPT)" in the right column. Click its

DC Inverter Multi VRF System II Service Manual

Step 4: Right-click "USB Serial Port (COM6) and then click "Properties". The dialog box of properties will then pop up.

Step 5: Then click "Port Settings" in the dialog box.

USB Serial Port (COM3) P	roperties ?	×

Installation

INSTALLATION 1 Engineering Installation Preparation and Notice

1.1 Installation notice

Personnel and property safety are highly concerned during the entire installation process. Installation implementation must abide by relevant national safety regulations to ensure personnel and property safety.

All personnel involved in the installation must attend safety education courses and pass corresponding safety examinations before installation. Only qualified personnel can attend the installation. Relevant personnel must be held responsible for any violation of the regulation.

1.2 Installation key points and importance

VRF air conditioning systems use refrigerant, instead of other agent, to directly evaporate to carry out the system heat. High level of pipe cleanness and dryness is required in the system. Since various pipes need to be prepared and laid out onsite, carelessness or maloperation during installation may leave impurities, water, or dust inside refrigerant pipes. If the design fails to meet the requirement, various problems may occur in the system or even lead to system breakdown.

No.	Installation Problem	Possible Consequence
1	Dust or impurities enter into the refrigeration system.	Pipes are more likely to be blocked; air conditioning performance is reduced; compressor wear is increased or even hinder the normal operation of the system and burn the compressor.
2	Nitrogen is not filled into the refrigerant pipe or insufficient Nitrogen is filled before welding.	Pipes are more likely to be blocked; air conditioning performance is reduced; compressor wear is increased or even hinder the normal operation of the system and burn the compressor.
3	The vacuum degree in the refrigerant pipe is insufficient.	The refrigeration performance is reduced. The system fails to keep normal operation due to frequent protection measures. When the problem getting serious, compressor and other major components can be damaged.
4	Water enters into the refrigeration system.	Copper plating may appear on the compressor and reduce the compressor efficiency with abnormal noise generated; failures may occur in the system due to ice plug.
5	The refrigerant pipe specifications do not meet the configuration requirements.	Smaller configuration specifications can increase the system pipe resistance and affect the cooling performance; larger configuration specifications are waste of materials and can also reduce the cooling performance.
6	Refrigerant pipe is blocked.	The cooling performance is reduced; in certain cases, it may cause long-term compressor operating under overheat conditions; the lubricating effect can be affected and the compressor may be burnt if impurities were mixed with the lubricating oil.
7	Refrigerant pipe exceeds the limit.	The loss in pipe is considerable and the unit energy efficiency decreases, which are harmful for long-term running of the system.
8	Incorrect amount of refrigerant is filled.	The system cannot correctly control the flow allocation; the compressor may be operating under over-heating environment or running when the refrigerant flows back to the compressor.
9		Insufficient refrigerant circulating in the system decreases the cooling performance of the air conditioner. Long-term operation under such circumstance may cause an overheating compressor or even damage the compressor.
10	Water drainage from the condensate water pipe is not smooth.	Residual water in IDUs can affect the normal operation of the system. The possible water leakage can damage the IDU's decoration.

Problems that usually occur during installation are as follows:

No.	Installation Problem	Possible Consequence
11	The ratio of slop for condensate water pipe is insufficient or the condensate water pipe is incorrectly connected.	Reverse slop or inconsistent connection of condensate water pipe can hinder the smooth drainage and cause leakage of the IDU.
12	The air channel is improperly fixed.	The air channel will deform; vibration and noise occur during unit operating.
13	The guide vane of air channel is not reasonably manufactured.	Uneven air quantity allocation reduces the overall performance of the air conditioner.
14	The refrigerant pipe or condensate water pipe does not meet the insulation requirement.	Water can easily condensate and drip to damage the indoor decoration, or even trigger the protection mode of system due to overheating operation.
15	The installation space for IDU is insufficient.	Since there is a lack of space for maintenance and checking, indoor decoration might need to be damaged during such operation.
16	The IDU or the location of the air outlet or return air inlet is not designed reasonably.	The air outlet or return air inlet may be short-circuited, thus affecting the air conditioning performance.
17	The ODU is improperly installed.	The ODU is difficult to be maintained; unit exhaust is not smooth, which reduces the heat exchanging performance or even prevent the system from normal operation; in addition, the cold and hot air for heat exchange and the noise may annoy people in surrounding areas.
18	Power cables are incorrectly provided.	Unit components may be damaged and potential safety hazard may occur.
19	Control communication cables are incorrectly provided or improperly connected.	The normal communication in the system fails or the control over IDUs and ODUs turn in a mess.
20	Control communication cables are not properly protected.	The communication cables are short-circuited or disconnected, and the unit cannot be started up due to communication failure.

Understand the special requirement (if any) for unit installation before implementation to ensure installation quality. Relevant installers must have corresponding engineering construction qualifications.

Special type operators involved in the engineering implementation, such as welders, electricians, and refrigeration mechanics must have relevant operating licenses and are accredited with vocational qualification certification.

2 Installation Materials Selection

The materials, equipment and instruments used during air conditioning engineering construction must have certifications and test reports. Products with fireproof requirements must be provided with fireproof inspection certificates and must meet national and relevant compulsory standards. If environmentally-friendly materials are to be used as required by customers, all such materials must meet national environmental protection requirement and be provided with relevant certificates.

2.1 Refrigerant piping

- a. Material requirement: Dephosphorization drawing copper pipe for air conditioners;
- b.Appearance requirement: The inner and outer surface of pipe should be smooth without pinhole, crack, peeling, blister, inclusion, copper powder, carbon deposition, rust, dirt or severe oxide film, and without obvious scratch, pit, spot and other defects.
- c.Test report: Certifications and quality test reports must be provided.
- d.The tensile strength must be at least 240 kgf/mm².

	R410A Refrigerant System						
OD (mm/inch)	Wall Thickness (mm)	Model					
Ф6.35(1/4)	≥0.8	0					
Ф9.52(3/8)	≥0.8	0					
Ф12.70(1/2)	≥0.8	0					
Ф15.9(5/8)	≥1.0	0					
Ф19.05(3/4)	≥1.0	0					
Φ22.20(7/8)	≥1.2	0					
Ф25.40(8/8)	≥1.2	0					

e. Specifications requirement

f. After the inner part of the copper pipe is cleaned and dried, the inlet and outlet must be sealed tightly by using pipe caps, plugs or adhesive tapes.

2.2 Condensate water pipe

- a. Pipes that can be used for air conditioner drainage include: water supplying UPVC pipe, PP-R pipe, PP-C pipe, and HDG steel pipe;
- b. All relevant certificates and quality test reports are provided.
- c. Requirements for specifications and wall thickness

Water supplying UPVC pipe: Φ32mm×2mm, Φ40mm×2mm, Φ50mm×2.5mm;

HDG steel pipe: Φ 25mm×3.25mm, Φ 32mm×3.25mm, Φ 40mm×3.5mm, Φ 50mm×3.5mm.

2.3 Insulation material

- a. Rubber foam insulation material;
- b. Flame retardancy level: B1 or higher;
- c. Refractoriness: at least 120°C;
- d. The insulation thickness of condensate water pipe: at least 10 mm;
- e. When the diameter of copper pipe is equal to or greater than Φ15.9 mm, the thickness of insulation material should be at least 20 mm; when the diameter of copper pipe is less than 15.9 mm, the thickness of insulation material should be at least 15 mm.

2.4 Communication cable and control cable

Note: For air conditioning units installed in places with strong electromagnetic interference, shielded wire must be used as the communication cables of the IDU and wired controller, and shielded twisted pairs must be used as the communication cables between IDUs and between the IDU and ODU.

Wire Type		Number of Wire Pieces x Wire Diameter (mm ²)	Wire Standard	Remark
Common sheath twisted pair copper core (RVV)	L≤1000	≥2×0.75	GB/T 5023.3-2008	If the wire diameter is enlarged to 2×1mm2, the overall communication length can reach 1500 m.

Communication cable selection for ODU and IDUs

Wire Type		Number of Wire Pieces x Wire Diameter (mm ²)	Wire Standard	Remark				
Common sheath twisted pair copper core (RVV)	L≤250	≥2×0.75	GB/T 5023.3-2008	The overall communication length cannot exceed 250 m.				

Communication cable selection for IDU and wired controller

2.5 Power cable

Only copper conductors can be used as power cables. The copper conductors must meet relevant national standard and satisfy the carrying capacity of unit.

2.6 Hanger rod and support

- a. Hanger rod: M8 or M10;
- b. U-steel: 14# or above;
- c. Angle steel: 30mm×30mm×3mm or above;
- d. Round steel: Φ10mm or above

3 Installation of outdoor unit

3.1 Check before installation

- a. Before installation, please check the power cord if it complies with the power supply requirement on the nameplate. Make sure the power supply is safe.
- b. This air conditioner must be properly grounded through the receptacle to avoid electric shock. The ground wire shouldn't be connected with gas pipe, water pipe, lightning arrester or telephone line.
- c. Maintain good air circulation to avoid lacking oxygen.
- d. Read this manual carefully before installation.

3.2 Selection of installation site

- a. Select a location which is strong enough to hold unit's weight so that unit can stand still and erect.
- b. Make sure the unit is not exposed to sun and rain. And the location can resist dust, typhoon and earthquake.
- c. Please keep the unit away from inflammable, explosive and corrosive gas or waste gas.
- d. Make sure the location has space for heat exchange and maintenance so that unit can operate reliably with good ventilation.
- e. ODU and IDU should stay as close as possible to shorten the length of refrigerant pipe and reduce bend angles.
- f. Select a location which is out of children's reach. Keep the unit away from children.

3.3 Carrying and installing outdoor unit

When carrying the outdoor unit, hang the unit in four directions with two sufficient ropes. In order to avoid excursion from the center, the angel of ropes must be smaller than 40° during hanging and moving.

3.4 Installation notices

In order to ensure proper operation, the selection of installation site must conform to the following principle:

- •The discharged air of outdoor unit will not flow back and there is sufficient space around the unit for maintenance;
- •The installation site must be well ventilated to ensure sufficient air intake and discharge. Make sure there is no obstacle at the air inlet and air outlet. If there is any obstacle, please remove it;
- •The installation site shall be able to withstand the weight of outdoor unit and capable for soundproof and vibration. The air outlet and noise of unit will not affect neighbors;
- •The hanging of outdoor unit must use appointed hanging hole. Pay attention to protect the unit during hanging and installation. Prohibit hitting the sheet metal to avoid rust in the future.
- Avoid direct sunlight;
- The rain and condensation water can be drained out smoothly;
- The outdoor unit will not be embedded by the snow and not affected by garbage and oil smog;
- The installation of outdoor unit shall adopt rubber damping pad or spring damper to reduce noise and vibration;
- The installation dimension shall accord with the installation requirement of this manual and the outdoor unit must be fixed at the installation site;
- •The installation shall be done by professional technicians.

3.5 Fixing and damping of unit

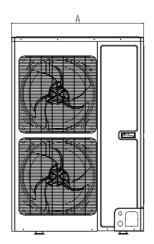

The outdoor unit shall be fixed with 4 M12 bolts and closely contacted with the foundation. Otherwise, big vibration and noise will be caused.

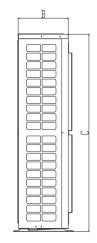

The outdoor unit shall be fixed firmly. The rubber board with thickness over 20mm or corrugated rubber damping pad shall be applied between the unit and foundation.

3.6 Outline dimension and position of installation hole

When carrying the outdoor unit, hang the unit in four directions with two sufficient ropes. In order to avoid excursion from the center, the angel of ropes must be smaller than 40° during hanging and moving.

3.7 Installation space requirement

If all sides of the ODU (including the top) are surrounded by walls, process according to the following requirements for installation space:

DEBUGGING & MAINTENANCE

DEBUGGING & MAINTENANCE 1 Debugging of Unit

Caution:

- 1. After the initial installation is finished and the main board of outdoor unit is replaced, it must perform debugging. Otherwise, the unit can't operate.
- 2. The debugging must be performed by professional person or under the the guide of professional person.

1.1 Preparation for debugging

- (1) Do not disconnect the power before the installation is finished,
- (2) All wires for controller and electric wires must be connected correctly and reliably.
- (3) Check the the fixing ring of the foot of compressor for transportaion is removed.
- (4) Remove all sundries from the unit, such as metal chips, joint, forceps holder, and so on.
- (5) Check whether the appearance and pipeline system are damaged during carry or transportation process.
- (6) Calculate the required added refrigerant-charging volume according to the length of pipe of system and pre-charge the refrigerant. If refrigerant can't be added any more when the required refrigerant-charging volume hasn't been reached, record to refrigerant volume which still needs to be added and continue to add refrigerant during run test operation process. Please refer to below run test for the refrigerant-adding stage during run test process.
- (7) After adding refrigerant, please make sure the valve for outdoor is opened completely.
- (8) For the convenient of troubleshooting, the unit can't be connected to the PC which installed with related debugging software and make sure that the the datas in real time of this unit can be inspected by this computer. Please refer to Service Manual for the installation and connection of the bebugging software.
- (9) Before turn test, please do make sure that the preheat time for compressor is 8h above and touch the compressor to see whether preheat is normal. You can perform run test only after normal preheat. Otherwise, it may damage the compressor.

1.2 Debugging of unit Debugging procedure for test run, display instruction for indicator on main board of outdoor unit and operation method are as below:

Stage process instruction for debugging								
		ugging ode	Proces	ss code	Status code			
	LI	ED1	LE	D2	LED3		Code instruction and operation method	
Process	Cod e	Display status	Code	Display status	Code	Displ ay status		
	db	ON	01	ON	AO	ON	No debugging status for system	
01_ Main control unit setting	db	ON	01	ON	OC	ON	Press SW7 button on main board for 5s to start system debugging. The indicator on main board is displayed as shown in the left. 2s later, it will enter into next step determination.	
	db	ON	02	ON	Ad	Flash	Address distribution for the system. 10s later, the display is as below:	
02_ Address distribution	db	ON	02	ON	L7	Flash	No main indoor unit. Display will be kept for 1min. Within 1min, set the main indoor unit through debugging software. If notset the main indoor unit by hand within 1min, the system will automatically set the minimum IP address as the main indoor unit.	
	db	ON	02	ON	OC	ON	The distribution for the system address is finished. 2s later, it will enter into the next step determination automatically.	
03_Quantity confirmation of	db	ON	03	ON	01	Flash	Cofirmation process of system. 1s later, it will enter into the next step automatically.	
outdoor unit	db	ON	03	ON	OC	ON	Cofirmation process of system. 2s later, it will enter into the next step automatically.	
04_Quantity confirmation of indoor unit	db	ON	04	ON	01~80	Flash	LED3 displays quantity of indoor unit. The quanity of indoor unit shall be confirmed by perform. If the actural quantity of indoor unit is different from the displayed quantity, cut off the power for indoor unit and outdoor unit. Check whether the communication wire for indoor unit is normal. After that, put through the power and start debugging from step 01. If the quantity of indoor unit is correct, press SW7 button on main board to confirm it. The display is as below after confirmation:	
	db	ON	04	ON	OC	ON	Confiration for the quantity of indoor unit of finished. 2s later, it will enter into the next step automatically.	
05_Internal communication and capacity ratio inspection for between indoor unit and outdoor unit	db	ON	05	ON	C2	ON	Communication between main board of outdoor unit and drive is abnormal. Please check whether the communication wire connecting main board of outdoor unit and drive board is normal? It will enter into the next operation after troubleshooting. If it needs to cut off the power during troubleshooting process, start the debugging from step 01 after energization.	
	db	ON	05	ON	OC	ON	Normal communication between main board of outdoor unit and drive. It will displays for 2s by the left method. With this 2s, the capacity ratio for indoor unit and outdoor unit will be detected automatically. If it hasn't exceeded the	

Stage process instruction for debugging								
		ugging ode	Proces	ss code	Status code			
		ED1	LE	D2	LED3		Code instruction and operation method	
Process	Cod e	Display status	Code	Display status	Code	Displ ay status		
							capacity ratio range, it will enter into next step determination after 2s; if it has exceed the capactiry ration, display is as below:	
	db	ON	05	ON	СН	ON	The rated capacity ratio for indoor unit is high. Change the combination for indoor unit and outdoor unit to let their capacity ration is within the reasonable range. Perfrom the debugging again from step 01.	
	db	ON	05	ON	CL	ON	The rated capacity ratio for indoor unit is low. Change the combination for indoor unit and outdoor unit to let their capacity ration is within the reasonable range. Perfrom the debugging again from step 01.	
06_Parts detection for outdoor unit	db	ON	06	ON	Correspond ing error code	ON	Malfunction of parts for outdoor unit. LED3 displays corresponding malfunction code. After troubleshooting, it will enter into the next step determination automatically. If it needs to cut off the power for the outdoor unit during troubleshooting process, perform the debugging again from step 01 after energization.	
	db	ON	06	ON	OC	ON	When there's no malfunction of parts for outdoor unit, it will enter into the next step determination automatically after 10s.	
07_Parts detection for indoor unit	db	ON	07	ON	XXXX/corre sponding error code	ON	The system detected that there's malfunction for the parts of indoor unit. XXXX indicates the engineering series code for the indoor unit with malfunction. 3s later, corresponding malfunction code will be displayed. Eg: When there is malfunction d5 and d6 for no. 1 indoor unit, and malfunction d6 and d7 for no. 792 indoor unit, LED3 nixie tube will display 00, 01, d5, d6, 07, 92, d6, d7 cyclely evey 2s. After troubleshooting, it will enter into the next step determination automatically. If it needs to cut off power for outdoor unit during troubleshooting process, perform the debugging again from step 01 after energization.	
	db	ON	07	ON	OC	ON	No parts malfunction for indoor unit. 2s later, it will enter into the next determination automatically.	
08_ Preheat confirmation for compressor	db	ON	08	ON	UO	ON	Preheat time for compressor is not reached to 8h. Indicator will display as shown by the left method until the reheat time for compressor is reached to 8h. or short press SW7 button on main board to confirm that the preheat time is reached to 8h and then enter into the next determination. (Note: If compressor isn't started up when the preheat time is not reached to 8h, the compressor may be damaged. Please be careful.)	

Stage process instruction for debugging								
	Debugging code		Proces	ss code	Status co	ode		
		ED1	LE	LED2 LED3			Code instruction and operation method	
Process	Cod e	Display status	Code	Display status	Code	Displ ay status		
	db	ON	08	ON	OC	ON	Preheat time for compressor is reached to 8h. 2s later, it will enter into the next step.	
09_ Refrigerant confirmation before startup	db	ON	09	ON	U4	ON	Refrigerant in system is not sufficient. The indicator will display by the left method. Please disconnect the power for indoor unit and outdoor unit, and check whether the pipeline is leaking. After leakage problem is solved, recharge the refrigerant according to requirement. After that, energize the unit and perform the debugging from step 01. (Note: Cut off the power for the unit before recharging the refrigerant to prevent the unit entering into step 10 during refrigerant-charging process)	
	db	ON	09	ON	OC	ON	The refrigerant volume for the system is normal. After it displayes as the left method for 2s, it will enter into the next determination automatically.	
10_ Status determination for outdoor unit's valve before startup	db	ON	10	ON	ON	ON	Dermination status for valve of outdoor unit; After compressor operating for about 2min, it will stop operation. It will judge the ON status of gas valve and liquid valve for outdoor unit. The judement result is displayed as below:	
	db	ON	10	ON	U6	ON	Valve for outdoor unit hasn't been opened completely. Short press SW6 button on main board and the indicator will display "db 09 OC" and then check whether gas valve and liquid valve for outdoor unit are opened completely. After that, short press SW6 button on main board again. After compressor is started up and operated for about 2min, it will judge the status of valve again.	
	db	ON	10	ON	OC	ON	Normal status for valve. After it displays as the left method for 2s, it will enter into the next determination automatically.	
	db	ON	12	ON	AP	Flash	Wait for confirming the debugging order for the unit. Short press SW7 button on main bard to confirm the debugging of unit. 2s later, the indicator on main board will display as below:	
12_ Debugging confirmation for the unit	db	ON	12	ON	AE	ON	Confirmation of startup of the unit. After displaying for 2s, the system will select "15_cooling ddebugging operation" or "16_heating debugging operation" automatically according ambient temperature to start up operation. If it needs to add refrigerant because of engineering requirement while the refrigerant hasn't been added finished before debugging, refrigerant can be added through low-pressure detection valve during operation process.

15_Debugging operation for	db	ON	15	ON	AC	ON	Debugging under cooling mode. If there's no malfunction after the compressor operates for 20min, it will enter into process 17 to finish debugging; If there's malfunction during operation process, the display is as below:	
cooling	db	ON	15	ON	Correspodi ng error code	ON	There's malfunction during debugging process under cooling mode. After removing all malfunctions, it will enter into the next step determination.	
16_Debugging operation for heating	eration for	Debugging under heating mode. If there's no malfunction after the compressor operates for 20min, it will enter into process 17 to finish debugging; If there's malfunction during operation process, the display is as below:						
neating	db	ON	16	ON	Correspodi ng error code	ON	There's malfunction during debugging operation under heating mode. The unit will enter into the next step determination after elimanted all malfunctions.	
17_ Finished status of debugging	00	ON	AC/AH	ON	OFF	ON	Debugging is finished for the complete unit. The system is at standby status.	

1.3 Parameters reference value for the normal operation of unit

No.	Debuggi	ing project	Parameters name	Unit	Reference value
1			Outdoor ambient temperature	°C	
2			Discharge temperature of compressor	°C	 After compressor is started up, normal discharge temperature for cooling is 70~105°C, which is 10°C above more than the high pressure saturation temperature. The normal temperature for heating is 65°C~90°C, which is 10°C above more than the high pressure saturation temperature.
3			Defrosting temperature	°C	 During cooling operation, defrosting temperature is 4~10 °C lower than the high pressure value of system; During heating operation, defrosting temperature is almost equal to the low pressure value of system (the disffrence is withing 2 °C).
4		Parameters of outdoor unit	High pressure of system	Ĉ	 Under cooling mode, the normal high pressure value is 20°C ~55°C. According to the change of ambine temperature and operation capacity of system, the high pressure value of system is 10°C ~30°C higher than the ambient temperature. The higher the ambient temperature, the temperature difference is small; Under cooling operation at the ambient temperature of 25~35°C, the high pressure value for the system is 44~53°C; The unit will operate at heating mode when the ambient temperature is above -5°C. The high pressure value for the system is 40~52°C. When the ambient temperature is low and the indoor unit is started up frequently, the high pressure value will be a little lower.
5	Paramers of system		Low pressure of system	°C	 The unit will operate under cooling mode when the ambient temperature is 25~35℃, the low pressure value for the system is 0~8℃. The unit will operate under heating mode when the ambient temperature is above -5℃, the low pressure value for the system is -15~8℃.
6			Opening angle of electrocnic expansion valve for heating	PLS	 During cooling operation, the electronica expansion valve for heating will always be kept at 480PLS; During heating operation, the opening angle for the adjusted electronic expansion valve is 55~480PLS.
7			Operation frequency for compressor	HZ	Change among 10HZ~95HZ
8			Operation current of compressor	A	Current should be no more than 25.0A during normal operation for compressor
9			IPM module temperature for compressor	°C	When ambient temperature is lower than 35 °C, temperature for IPM module is lower than 80 °C. The maximum temperature won't exceed 95 °C.
10			Operation frequenc for fan	HZ	It will adjust the frequency among 0~49HZ for operation according to the system pressure
11			Ambient temperature for indoor unit	°C	
12		Parameters of indoor	Entry tube temperature for indoor heat exchanger	°C	 According to the difference of ambient temperature, the entry tube temperature is 1°C~7°C lower than the exit tube temperature for the same indoor unit under cooling mode;
13		unit	Entry tube temperature for indoor heat exchange	°C	 4~9°C higher than low pressure. Under heating mode, entry temperature is 10°C ~20°C lower than exit tube temperature for the sae indoor unit.
14			Opening angle	PLS	Under cooling mode, the opening angle for indoor electronic

No.	Debugging project	Parameters name	Unit	Reference value
		of indoor electrocnic expansion valve		expansion valve is adjusted among 70~480PLS. Under heating mode, the opening angle for indoor unit is adjusted among 40~480PLS.
15	Communication paraters	Communication data		Through debugging software, it detected that the quantity of indoor unit is same with the enginerring actural quantity. There's no communication malfunction.
16	Drainage syste	Drainage syste		Water can be drained smoothly for indoor unit; Outdoor unit can drain water fromo drainage pipe completely.
17	Other			

2 Malfunction List

2.1 Malfunction list for the wired controller

Display code	Content	Display code	Content	Display code	Content
LO	Malfunction of indoor unit	L9	Wrong number of indoor unit for one-to-more indoor unit	d8	Malfunction of water temperature sensor
L1	Indoor fan protection	LA	Wrong series for one-to-more indoor unit	d9	Malfunction of jumper cap
L2	E-heater protection	LH	Alarming due to bad air quality	dA	Abnormal address for indoor unit
L3	Water overflow protection	LC	The indoor unit model can't match with outdoor unit model	dH	Abnormal PCB for wired controller
L4	Power supply of wired controller is faulted	d1	Poor indoor PCB	dC	Abnormal code-dialing setting of capacity
L5	Freeze prevention protection	d3	Malfunction of ambient temperature sensor	dL	Malfunction of air exhause temperature sensor
L6	Mode shock	d4	Malfunction of entry tube temperature sensor	dE	Malfunction of indoor C02 sensor
L7	No main indoor unit	d6	Malfunction of exit tube temperature sensor	C0	Communication malfunction
L8	Insufficient power supply	d7	Malfunction of humidity sensor	AJ	Clean alarming for filter
db		S	pecial code: engineering debug	iging code	

2.2 Status display table for indicators on main board of outdoor unit Definition:

- LED1: It displays "00" for hot water mode as for DC Inverter Side Discharge VRF
- LED2: It displays "AC" for AC mode, cooling and cooling OFF mode for indoor unit, and displays "AH" for heating and heating OFF mode for indoor unit
- LED3: It displays on or off status of compressor and malfunction code. It displays "ON" when the compressor is operating and "OFF" when the compressor stops operation. When there's malfunction for the unit, it will display corresponding malfunction code; when there're multiple malfunctions, the malfunction codes will be displayed in turn.

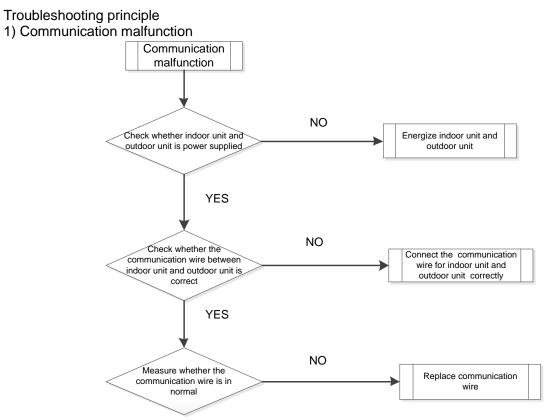

Display code table of outdoor unit is as below:

Display code	Content	Display code	Content	Display code	Content
E0	Malfunction of outdoor unit	E1	High pressure protection	E2	Low-temperature protection for dicharge
E3	Low pressure protection	E4	Discharge high temperature protection for compressor	EC	Loose protection for discharge temperature sensor for compressor 1
F0	Poor main board of outdoor unit	F1	Malfunction of high pressure sensor	F3	Malfunction of low pressure sensor
F5	Malfunction of discharge temperature sensor for compressor 1	FP	Malfunction of DC motor	JO	Other module protection
J1	Overcurrent protection for compressor 1	J7	Air-mixing protection for 4-way valve	J8	High pressure ration protection of system
J9	Low pressure ratio protection of system	JL	High pressure is too low	b1	Malfunction for outdoor ambient temperature sensor
b2	Maflunction of defrosting temperature sensor 1	b3	Maflunction of defrosting temperature sensor 2	b4	Malfunction of liquid temperature sensor for subcooler
b5	Malfunction of gas temperature sensor for subcooler	b6	Malfunction for temperature sensor of inlet tube of gas and liquid separator	b7	Malfunction for temperature sensor of exit tube of gas and liquid separator (exit tube A)
b9	Malfunction of gas exit temperature sensor for heat exchanger	bH	Abnormal clock of system	P0	Malfunction driven board for compressor
P1	Driven board of compressor works abnormally	P2	Power voltage protection for the driven board of compressor	P3	Reset protection for the driven module of compressor
P4	Driven PFC protection of compressor	P5	Overcurent protection for inverter compressor	P6	Driven IPM module protection for compressor
P7	Malfunction of driven temperature sensor for compressor	P8	Overheating protection for driven IPM of compressor	P9	Desynchronizing protection for inverter compressor
РН	High voltage protection for driven DC bus bar of compressor	PC	Circuit malfunction of driven current detection for compressor	PL	Low voltage protection for driven DC bus bar of compressor
PE	Phase-losing of inverter compressor	PF	Malfunction of driven charging loop for compressor	PJ	Failure start up for inverter compressor
PP	AC current protection for inverter compressor	UO	Preheat time is not enough for compressor	U2	Capacity code of outdoor unit/wrong setting of jumper cap
U4	Insufficient refrigerant protection	U5	Wrong address for the driven board of compressor	U6	Alarm due to abnormal valve
U8	Malfunction of pipeline for indoor unit	U9	Malfunction of pipeline for outdoor unit	UC	Setting for indoor unit and oudoor unit is succeeded
UL	Wrong code-dialing during emergency operation	UE	Refrigerant-charging is invalid	C0	Communication malfunction for indoor unit, outdoor unit and wired controller of indoor unit
C2	Driven communication malfunction between main board and inverter compressor	C3	Driven communication malfunction between main board and inverter compressor	C4	Malfunction of indoor unit-lacking
C5	Alarming due to engineering series number shock of indoor unit	C6	Alarming due to wrong quanity of outdoor unit	C8	Emergency status of compressor
C9	Emergency status of fan	СН	High rated capacity	СС	No malfunction of main control unit
CA	Energycy status of module	CF	Malfunction of main control unit	CJ	Address shock of syste
CL	Low rated capacity	CU	Communication malfunction between indoor unit receiving lamp board	Cb	Distribution overflow of Ip address

3 Troubleshooting

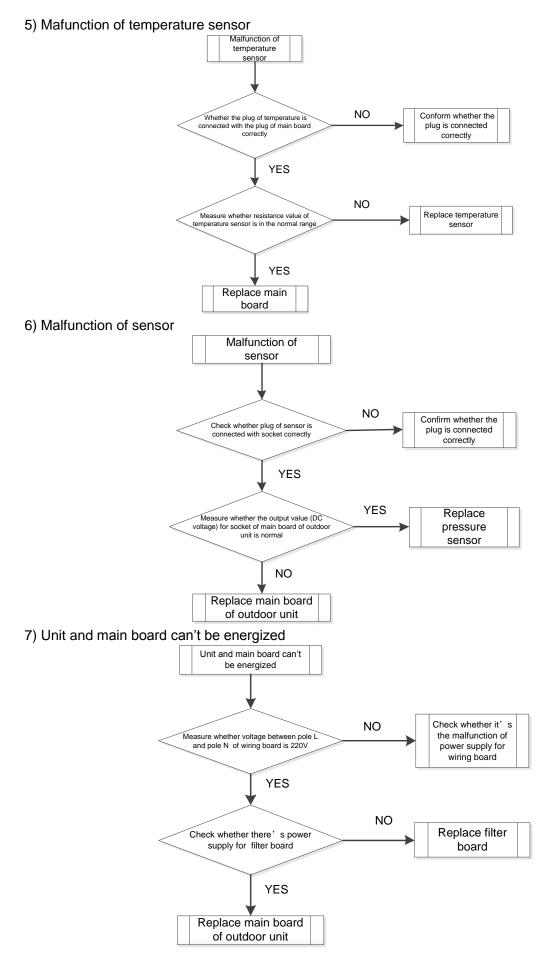

2) High pressure protection

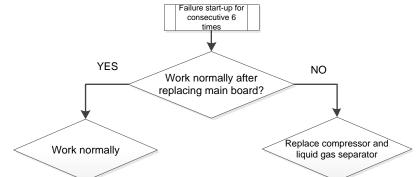

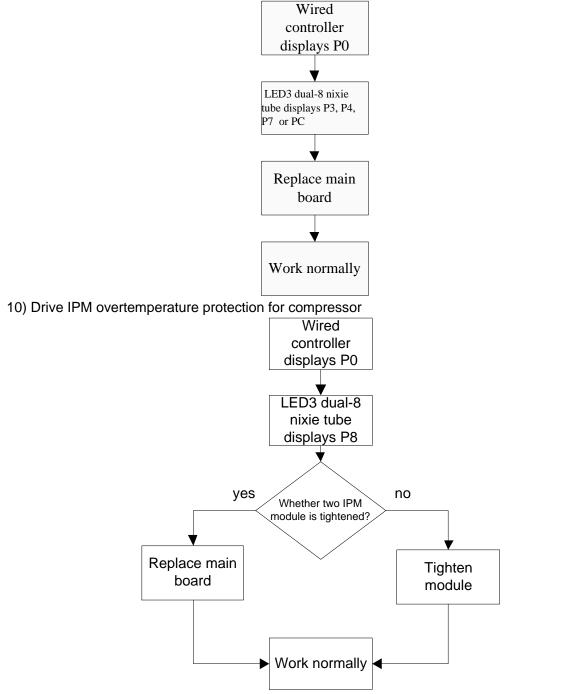

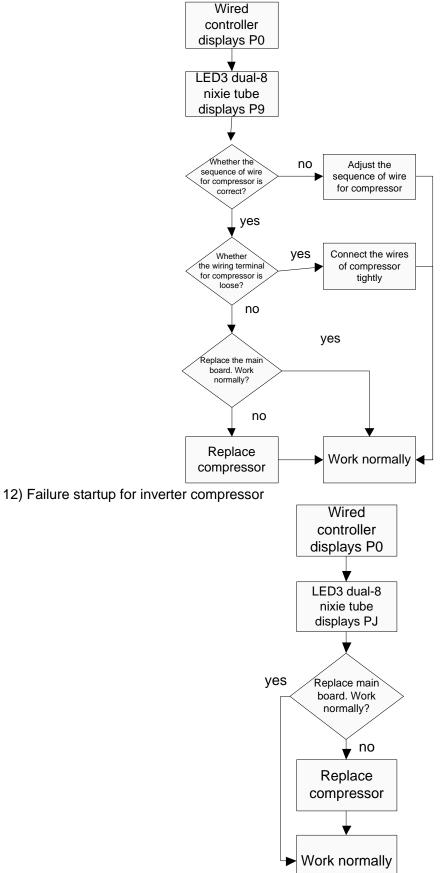

8) Failure start-up

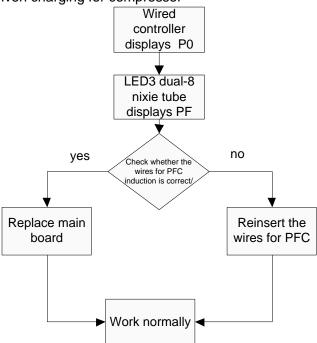

9) Reset protection for drive module of compressor, drive PFC protection for compressor, malfunction of drive temperature sensor for compressor, circuit malfunction of drive current detection for compressor

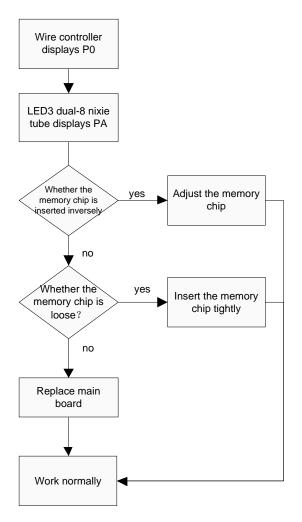

11) Desynchronizing protection for inverter compressor

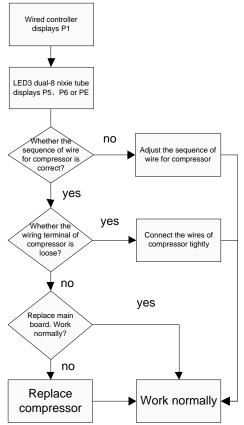

13) Loop malfunction of driven charging for compressor

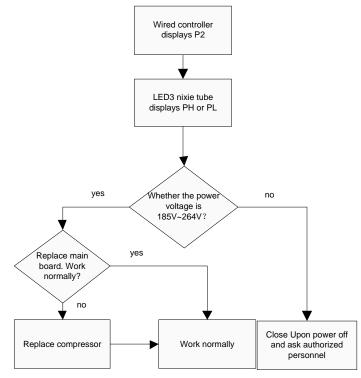

14) Malfunction of memory chip for inverter compressor

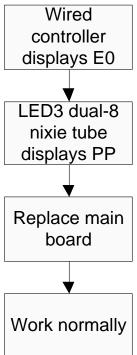

15) Overcurrent protection for inverter compressor, IPM module protection, phase-lacking of inverter compressor

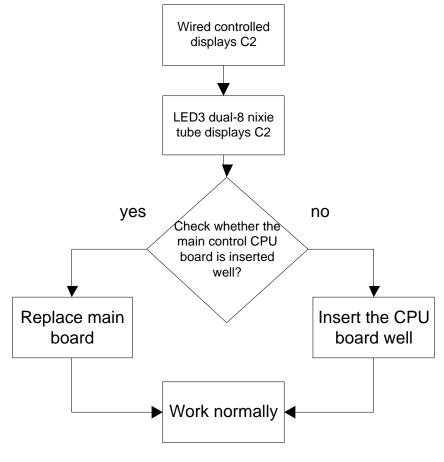

16) High pressure protection for driven DC bus bar of compressor, low pressure protection for driven DC bus bar of compressor

17) AC current protection for inverter compressor

18) Communication malfunction between main contoller and driver of inverter compressor

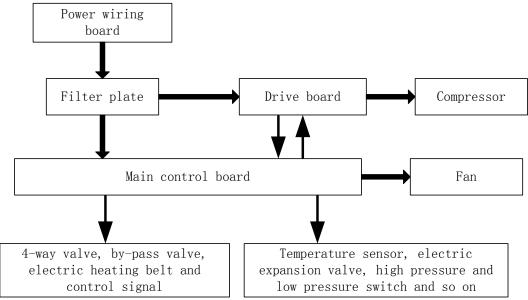

4 Power Distribution of Unit

4.1 Power distribution of unit

The control logical relationship among parts inside the electric box of unit is showed by the mongline diagram (CAD source file).

The main loop is showed by bold line (line width: 1mm); the control loop is showed by slim line (line width: 0.2mm).

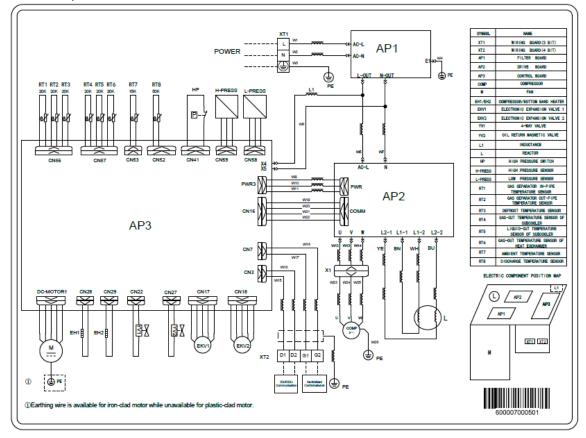

(Bold line is the power line and the slim line is the control line)

4.2 Main electric parts

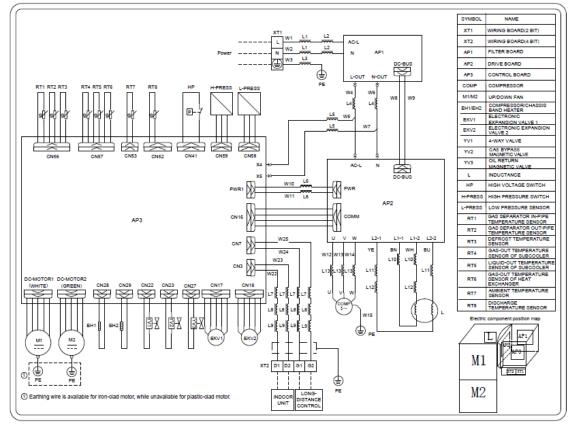

Name	Photo	Function introduction
Filter plate		It main effect is to eliminate the interference of power for protecting unit's anti-interference capability and prevent the interference to other electric appliances.
IPM Module		There are three complemental IGBT tube inside the IPM module. They are controlled by PWM wave and then bring the pressure of DC bus bar to different stator windings of compressor at different stage, and then generate current on the stator. Meanwhile, magnetic field will be generated on the stator winding, and push the operation of rotor and then drive compressor to operate.
PFC module		Four diodes and two MOS pipe are intergrated inside the PFC module. It will transform AC input power into DC power. Meanwhile, MOS pipe is controlled by PWM wave. Pressure will be increased by induction.

5 Removal of Parts

5.1 Key parts

Photo	Name	Function
	compressor	Core part of air conditioning system. It sucks low temperature and low pressure gas, compress it to high temperature and high pressure gas, and then discharge it.
	Electronic expansion valve	Throttling device. It transforms high pressure refrigerant liquid into low pressure steam.
	4-way valve	It changes the flow direction of refrigerant for switching between cooling and heating.
	Oil separator	It stays between discharge outlet of compressor and inlet of condenser. It used for separating the lubricant oil of compressor when the high temperature and high pressure refrigerant gas is discharged from the compressor.

Photo	Name	Function
	Vapour liquid separator	It stays between outlet of evaporator and suction ouitlet of compressor. It used for separating low temperature and low pressure refrigerant.
	High pressure liquid storage tank	It used for storing the superfluous high pressure refrigerant liquid during cooling process.
	Solenoid valve	
	Cut-off valve	It used for connecting indoor unit and outdoor unit, and used for maintenance and installation.

5.2 Removal of key parts

6 Common Maintenance

6.1 Vacuum drying for the system

6.1.1 Selection requirement for the vaccum pump

Do not use different vacuum pump for vaccum-pumping for different refrigerant system; The final vacuum for the vacuum pump should reach -0.1Mpa;

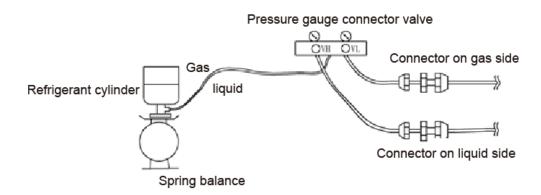

The air discharge volume for the vacuum pump should reach 4L/S above;

The precision of vacuum pup should reach 0.02mmHg above;

The system vacuum pump for R410A must be with check valve.

6.1.2 Operation procedure and notices for Vacuum drying

- 1) Operation procedure
- a. Before vacuum-pumping, please confirm that the cut-off valve for gas pipe and liquid pipe is at off status;
- b. Use charging conduct pipe to connect the governing value and vacuum heat pump to the detection joint of gas valve and liquid valve;
- c. After vacuum-pumping for 4h, check whether the vacuum degree is reached to -0.1MPa or above; If not, there may be gas leakage. Please perform the leakage inspection again. If there's no gas leakage, please vacuum pump for another 2h.
- d. If the required vaccum degree can't be satisfied after vacuum-pumping for two times, there are water inside the pipeline. Please drain out the water by the method of vaccum damage. The detailed method: charge 0.05MPa nitrogen into the pipeline, vacuum pump for 2h and then keep the cacuum for 1h. If -0.1 MPa vaccum degree still can't be reached, repeat this operation unit! the water is drained out completely.
- After the vacuum pump is finished, turn off the valve of governing valve and stop vacuum pump and keep it for 1h. Please confirm that the pressure of governing valve hasn't been increased.
- a. Vacuum pump for the gas pipe and liquid valve at the same time;

- b. When turn off the vacuum pump to stop vacuum-pumping, please turn off the valve at first and then de-energize the vacuum pump;
- c. Keep the vacuum pump for 2h and confirm that the pressure of vacuum meter hasn't been increased.

6.2 Fill and charge refrigerant 6.2.1 Filling procedure of regrigerant

a. Calculate the additional volume of refrigerant (GMV-120WL/A-T、GMV-140WL/A-T、GMV-160WL/A-T、

GMV-120WL/A-X 、GMV-140WL/A-X、 GMV-160WL/A-X)

(1) Refrigerant quantity of outdoor unit before delivery:

	11/00								
Model	/IV-80 L/A-T	GMV-100 WL/A-T	GMV-12 1WL/A	GMV-120 WL/A-T	GMV-140 WL/A-T	GMV-160 WL/A-T	GMV-120 WL/A-X	GMV-140 WL/A-X	GMV-160 WL/A-X
Refrig erant Qty (kg)	1.8	1.8	2.0	5.0	5.0	5.0	5.0	5.0	5.0

Note:

①The refrigerant amount charged before delivery doesn't include the amount that needs to be added to indoor units and the connection pipeline.

2 Length of connection pipe is decided on site. Therefore the amount of additional refrigerant shall be

decided on site according to the dimension and length of field-installed liquid pipe.

- ③Record the amount of additional refrigerant for convenience of after-sales service.
- (2) Calculation of the amount of additional refrigerant

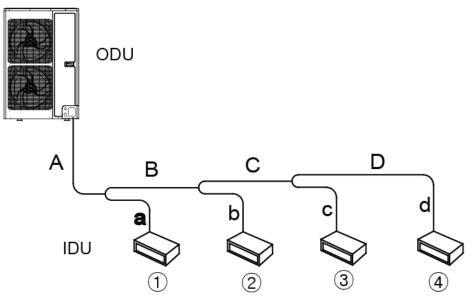

Calculation method of the quantity of additional refrigerant (based on liquid pipe) Quantity of additional refrigerant = ∑length of liquid pipe X quantity of additional refrigerant per meter

Quantity of additional refrigerant per meter for liquid pipe (kg/m)					
Φ22.2	Ф19.05	Φ15.9	Φ12.7	Ф9.52	Φ6.35
0.35	0.25	0.17	0.11	0.054	0.022

Note: Liquid pipe that is within 20m doesn't need to be added with refrigerant.

First confirm that there is no leakage from the system. When compressor is not working, charge additional R410a with specific amount to the unit through the filling opening of the liquid pipe valve of the outdoor unit. If required amount cannot be quickly filled due to pressure increase of the pipe, then set the unit in cooling startup and fill refrigerant from the low pressure check valve of the outdoor unit.

(3) Calculation example

The minimum quantity of additional refrigerant = 23×0.054+11×0.022=1.484kg

6.3 Airtightness test

6.3.1 Importance of airtightness test

The airtightness of VRF system is the leak tightness of the pipeline for refrigerant, which the guarantee for safe and reliable operation. The leakage of refrigerant may affect the operation of air conditioner seriously, or even damage compressor and then lead to breakdown of system. Therefore, it needs to perform the airtightness test. If the there's gas leakage after the system is installed completely, because the indoor ceiling decoration are all finished, it's will be very difficult to find out the leakage point. Thus, the airtightness test of the system must be finished before finishing indoor decoration.

6.3.2 Operation procedure for the airtightness test

Before ex-factory, cut-off valve for gas pipe and liquid pipe of outdoor unit is turned off. Please confirm that before operation.

Before testm please smear a little corresponding lubricant oil at and pipe terminal, and use two wrenches for fixing

Do not allow to connect the pipeline of outdoor unit for test during airtightness test.

The system test pressure for R410A is 4.15MPa (3.0MPa for R22 refrigerant system). Nitrogen must be used as the medium for the airtightness test and the nitrogen should be dry. Increase pressure slowly for three steps:

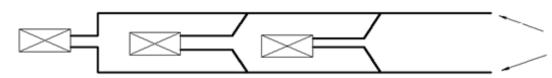

Step 1: Increase pressure slowly to 0.5MPa, stop for 5min and then check the gas leakage. Big leakage may be found out;

Step 2: Increase pressure slowly to 1.5MPa, stop for 5min to check the airtightness. Small leakage may be found out;

Step 3; Increase pressure slowly to 4.15MPa for R410A slowly (3.0MPa for R22 refrigerant system), stop for 5min and perform the strength test. Minor leakage or sand hole may be found. Increase pressure to test pressurem, keep it for 24h and observe whether the pressure is decreasing. If not, the pressure is qualified.

6.3.3 Cautions

- a. The test manometer range for R410A should be 4.5MPa above (3.5MPa above for R22 refrigerant system);
- b. Record the data on manometerk, ambient temperature and test time at the same time;
- c. Pressure modification: when temperature changes $1\,^\circ\!C$, the temperature will change 0.01MPa correspondingly.
- d. Pressure should be kept the same.
- e. If it needs to keep pressure for a long time, decrease the pressire lower than 0.55MPa pr below. Long-time high pressure can lead to leakage at the welding position, which may cause riskl.
- f. Before the airtightness for the pipeline of refrigerant is finished, do not allow to insulate and bundle the welding positions and connection position of bellmouth of indoor unit.

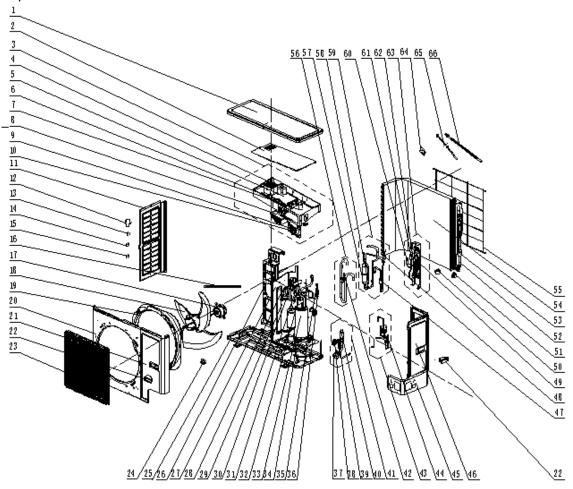

Add pressure from gas pipe and liquid pipeat the same time

Note: Before airtightness test, all welding lines can't be insulated and bundled.
